

JAVA

Tools in JDK

Tools

- javac
- javadoc
- jdb
- javah
- jconsole
- jshell
- ...

JAVA

javac

javac

- arguments

- cp

- encoding

- g debugging info

- g:none

- target version of bytecode (6, 7, 8, 9,...)

- release

- source version of language

- d directory for generated bytecode

- ...

JAVA

jshell

jshell

- interactive shell
- since Java 9

JAVA

javadoc

Overview

- a tool for automated generation of documentation from source codes
- class declarations etc. plus documentation comments
 - documentation directly in the code
 - easily kept up-to-date
- output – (implicitly) HTML pages
- documentation comments

```
/** comment */
```

 - written next to a documented element
 - contains – text + special tags + html code
- the `javadoc` program
 - included in JDK
 - generates documentation

Comments

- written next a documented element (without any empty new lines)

```
/** Commenting class */
public class MyClass {
    /** Commenting field */
    public int a;
    /** Commenting method */
    public void foo() {
        ...
    }
}
```

Comments

- ignored otherwise (considered as normal comments)

```
/** ignored */  
import java.util.*;  
  
public class MyClass {  
    void foo() {  
        /** ignored */  
    }  
}
```

Multi-line comments

- comments typically over several lines
- initial spaces and stars on second and subsequent lines are ignored
- without stars, the space are not ignored (since 1.3)

```
/** This is a multi-line comment.  
 * Initial spaces and stars  
 * are ignored and removed.  
 */
```

```
/** Initial spaces are not ignored as  
 * there is no star.  
 */
```

Parts of comments

- two parts in documentations comments
 - main description
 - part with tags
- first the main description, then the part with tags
 - cannot be swapped
 - the part with tags starts with a first tag (@something)

```
/** This is the main description. This is
 * still the main description.
 * @see java.lang.Object
 */
```

- comment can have only a single section

Types of tags

- "block tags"
 - @tag
 - standalone tags
 - can be placed only at the beginning of a line (initial spaces and stars ignored)
 - character @ is considered as normal character elsewhere
- "in-line tags"
 - {@tag}
 - can be anywhere in the text
 - also in the main description

@deprecated As of JDK 1.1,
replaced by {@link #setBounds(int,int,int,int)}

Comments

- first sentence = overview
 - a sentence ends with first dot followed by a white space (or by first tag)
 - shown
 - in a overview of class elements (methods, fields)
 - in the short description of a class
- one comment for several fields

```
/** A comment for both fields */
public int x, y;
```

HTML

- text of comments ~ HTML
- HTML tags can be used

```
/** This is a <b>documentation</b>
 * comment.
 */
```

- characters < > & should be written in a HTML form
 - < ... <
 - > ... >
 - & ... &
- usage of some tags is not recommended
 - e.g. headers <h1> <h2>
 - can break the structure of generated documentation

Inheriting comments

- if the comment is not present it is inherited from parents
 - overridden methods
 - implemented methods
- inherited only the part that is not defined
 - since 1.4
 - till 1.3 – presence of documentation comment prevents inheriting of anything
- explicit inheriting {`@inheritDoc`}

Package documentation

- documentation comments for a package
- the package.html file
- in the same directory as the package
- contains a HTML page
- to the documentation, everything between the tags
`<body> a </body>` is included
- it is written without `/** ... */`
- first sentence – short description of the package

- description of a group of classes
- the overview.html file
- the same structure as package.html

Tags

Tag	since	Tag	since
@author	1.0	@return	1.0
@{code}	1.5	@see	1.0
@{docRoot}	1.3	@serial	1.2
@deprecated	1.0	@serialData	1.2
@exception	1.0	@serialField	1.2
{@inheritDoc}	1.4	@since	1.1
{@link}	1.2	@throws	1.2
{@linkplain}	1.4	{@value}	1.4
{@literal}	1.5	@version	1.0
@param	1.0		

Tags for methods

```
/** Main description.  
 * @param p1 description of p1  
 * @param p2 description of p2  
 * @throws IOException when the  
 * exception is thrown  
 * @throws MyException when the  
 * exception is thrown  
 * @returns what is returned  
 */  
int foo(int p1, long p2) throws  
    IOException, MyException;
```

Other tags

- @since text
 - can be used everywhere
 - meaning: since which version of a sw the particular element exists
 - @since 1.4
- @exception
 - the same as @throws
- @author name
 - name of the author
 - can be used with classes, packages and overview

Other tags

- @see reference
 - "See also" header in the generated docs.
 - three possible formats
 - @see "string"
 - @see "The Java language specification"
 - @see label
 - @see package.class#member label
 - @see String#equals(Object) equals
 - @see java.io.File#exists() exists
- {@link package.class#member label}
 - a reference in a text (e.g. in the main description)
 - similar to @see

Other tags

- {@linkplain package.class#member label}
 - the same as {@link ...}
 - printed using the same font as for plain text
 - for {@link ...} another font is used (typically monospaced)
- @deprecated text
 - denotes API, which should not be used (intended for removal in future)
 - text – explanation why deprecated
 - the compiler checks for this tag
 - prints out a warning if deprecated API is used
 - since 5.0 – annotation @deprecated
- {@docRoot}
 - relative path to the root directory of the generated documentation

Other tags

- {@literal text}
 - a text that will not be interpreted
 - {@literal a**c**}
 - the generated documentation will contain **ac**
 - will not be interpreted as a tag
- {@code text}
 - the same as <code>{@literal text}</code>

javadoc

- generating documentation – javadoc
 - a part of the JDK
 - execution:

```
javadoc [arguments] [packages]  
[source_files]  
[-subpackages pkg1:pkg2:...]
```

Arguments for javadoc

- `-overview path/file`
 - a path to the file `overview.html`
- `-public`
 - include only public elements to the documentation
- `-protected`
 - include only public and protected elements
 - default behavior
- `-package`
 - include public, protected and package-private elements
- `-private`
 - include all elements

Arguments for javadoc

- `-doclet class`
 - doclet generates the documentation
 - default doclet generates HTML
- `-source 1.4`
 - version of source codes accepted
- `-sourcepath list_of_paths`
 - path for source files
- `-verbose -quiet`
 - level of verbosity
- `-locale language_country_variant`
 - if present it must be as first argument
- `-encoding encoding`
 - encoding of source files

Arguments for javadoc

- **-d path**
 - directory for generated documentation
- **-version**
 - **include tag @version**
- **-author**
 - **include tag @author**
- **-windowtitle text**
- **-doctitle text**
- **-header text**
 - placed to the beginning of each page
- **-footer text**
 - placed to the end of each page
- **-nodeprecated**
- **-nosince**

JAVA

ANT

Overview

- <http://ant.apache.org/>
- a tool for (not only) building of Java programs
- close to `make`
- written in Java
- extensible
 - by adding classes
- input file (buildfile)
 - (as makefile in `make`)
 - XML
- NetBeans internally uses Ant for compilation, execution, ... of projects

Buildfile

- **default name** build.xml
- **contains a single** project
- **and at least one** target

```
<?xml version="1.0" encoding="us-ascii" ?>
<project ...>
  <target ...>
    ...
  </target>
  <target ...>
    ...
  </target>
</project>
```

Project

- attributes
 - name
 - name of the project
 - default
 - default target that will be executed if no target is explicitly given
 - mandatory attribute
 - basedir
 - a base directory for all paths in the file
- optional element <description>
 - description of the project

```
<project name="Project" default="compile"  
        basedir=".">"  
    <description>A long description of the  
        project</description>
```

Target

- a sequence of tasks that have to be executed
- can depend on other targets
 - is executed after them
- attributes
 - name
 - mandatory
 - depends
 - a list of targets on which the targets depend
 - description
 - short description
 - if
 - the name of a property that must be set
 - unless
 - the name of a property that must not be set

Target

```
<target name="compile" depends="init"  
       description="Compile the app">  
    . . .  
</target>
```

Task

- executable code
- different number of arguments
 - depends on the particular task
- core
- optional
- own

```
<name attr1="value" attr2="value" .../>
```

```
<javac srcdir="..." destdir="..."/>
```

Property

- name and value
- name – case sensitive
- obtaining the value - \${property}
- built-in properties
 - basedir
 - ant.file
 - ant.version
 - ant.project.name
 - ant.java.version
 - system properties of Java
- own properties
 - <property name="name" />

Example

```
<?xml version='1.0' encoding='us-ascii'?>
<project basedir"." default="compile" name="Project">
    <description>Project description</description>

    <property name="src" location="src"/>
    <property name="classes" location="classes"/>

    <target name="init">
        <mkdir dir="${classes}" />
    </target>

    <target name="compile" depends="init"
description="Compile">
        <javac debug="true" destdir="${classes}"
srcdir="${src}" includes="**/*.java"
classpath="${src}" />
    </target>

    <!-- continuation -->
```

Example

```
<!-- continuation -->

<target name="run" depends="init,compile"
       description="Execute">
    <java fork="true" classname="Main"
          classpath="${classes}" />
</target>

</project>
```

Execution

- ant [arguments] [target [target2 ...]]
- **arguments**
 - projecthelp, -p
 - **project help**
 - **description of the project + description of tasks**
 - propertyfile <file>
 - **defines properties from the file**
 - D<property>=<name>
 - **definition of properties**
 - buildfile <file>
 - file <file>
 - f <file>
 - **buildfile**

Task javac

- executes the Java compiler
- compiles only those file that have to be compiled
 - no .class file or .class file is older than .java
 - warning!
 - only by names of files
 - i.e. does not know about inner classes, etc.
- attributes
 - srcdir
 - directory with .java files
 - mandatory
 - destdir
 - directory for .class files
 - classpath
 - CLASSPATH

Task javac

- attributes
 - encoding
 - encoding
 - source
 - -source attribute for javac
 - compiler
 - which compiler should be used
 - fork
 - true or false (default is false)
 - whether to execute the compiler in the same JVM as ANT or in a new one
- srcdir, classpath (and others) can be substituted by nested elements <src>, <classpath> (and others)

Task java

- executes a Java program
- attributes
 - classname
 - a class to be run
 - jar
 - jar-file to be run
 - mandatory either classname or jar
 - classpath
 - fork
 - run in a new JVM
- nested elements
 - <arg>
 - command-line arguments

Task property

- sets property(-ies) to a given value(s)
- value cannot be changed
- attributes
 - name
 - name of the property
 - value
 - value of the property
 - location
 - absolute path of the given files
 - file
 - file from which the properties should be read
 - url
 - url from which the properties should be read

Task property

- example

```
<property name="src" location="src"/>
<property name="foo.dist" value="dist"/>
<property file="foo.properties"/>
<property url="http://...." />
```

Task javadoc

- runs javadoc
- attributes
 - sourcepath – directories with sources
 - sourcefiles – source files to be processed
 - packagenames – for which packages docs should be generated
 - destdir – directory for generated docs
 - public, protected, package, private – for which elements docs should be generated
 - author – include @author
 - version – include @version
 - ... many others

Others

- many other tasks
 - delete
 - deletes files/directories
 - move
 - move/ rename
 - mkdir
 - creating a directory
 - copy
 - copying
 - echo
 - prints out a text to the std output

JAVA

Maven

Overview

- <http://maven.apache.org/>
- a tool for managing projects
 - roughly, Maven can be seen as an Ant extension
 - but it is not an Ant extension
- provides
 - dependency management
 - project building
 - usage of “best practices”
 - extensibility by new modules
 - ...

Usage

- a project generation

```
mvn archetype:generate
```

```
  -DarchetypeGroupId=org.apache.maven.archetypes
```

```
  -DgroupId=com.mycompany.app
```

```
  -DartifactId=my-app
```

- archetype ~ a project template
- generates the following structure

Project structure

```
my-app
|-- pom.xml
`-- src
    |-- main
    |   '-- java
    |       '-- com
    |           '-- mycompany
    |               '-- app
    |                   '-- App.java
    '-- test
        '-- java
            '-- com
                '-- mycompany
                    '-- app
                        '-- AppTest.java
```

POM – Project Object Model

- a project definition

```
<project xmlns="http://maven.apache.org/POM/4.0.0"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://maven.apache.org/POM/4.0.0
                      http://maven.apache.org/xsd/maven-4.0.0.xsd">
  <modelVersion>4.0.0</modelVersion>
  <groupId>com.mycompany.app</groupId>
  <artifactId>my-app</artifactId>
  <packaging>jar</packaging>
  <version>1.0-SNAPSHOT</version>
  <name>Maven Quick Start Archetype</name>
  <url>http://maven.apache.org</url>
  <dependencies>
    <dependency>
      <groupId>junit</groupId>
      <artifactId>junit</artifactId>
      <version>3.8.1</version>
      <scope>test</scope>
    </dependency>
  </dependencies>
</project>
```

Build lifecycle

- mvn “phase”
 - previous phases are also executed
1. process-resources
 2. compile
 3. process-test-resources
 4. test-compile
 5. test
 6. package
 7. install
 8. deploy

Others

- generating different project types

```
mvn archetype:generate \
    -DarchetypeGroupId=org.apache.maven.archetypes
    -DarchetypeArtifactId=maven-archetype-webapp
    -DgroupId=com.mycompany.app
    -DartifactId=my-webapp
```

- generating documentation

```
mvn archetype:generate
    -DarchetypeGroupId=org.apache.maven.archetypes
    -DarchetypeArtifactId=maven-archetype-site
    -DgroupId=com.mycompany.app
    -DartifactId=my-app-site
```

JAVA

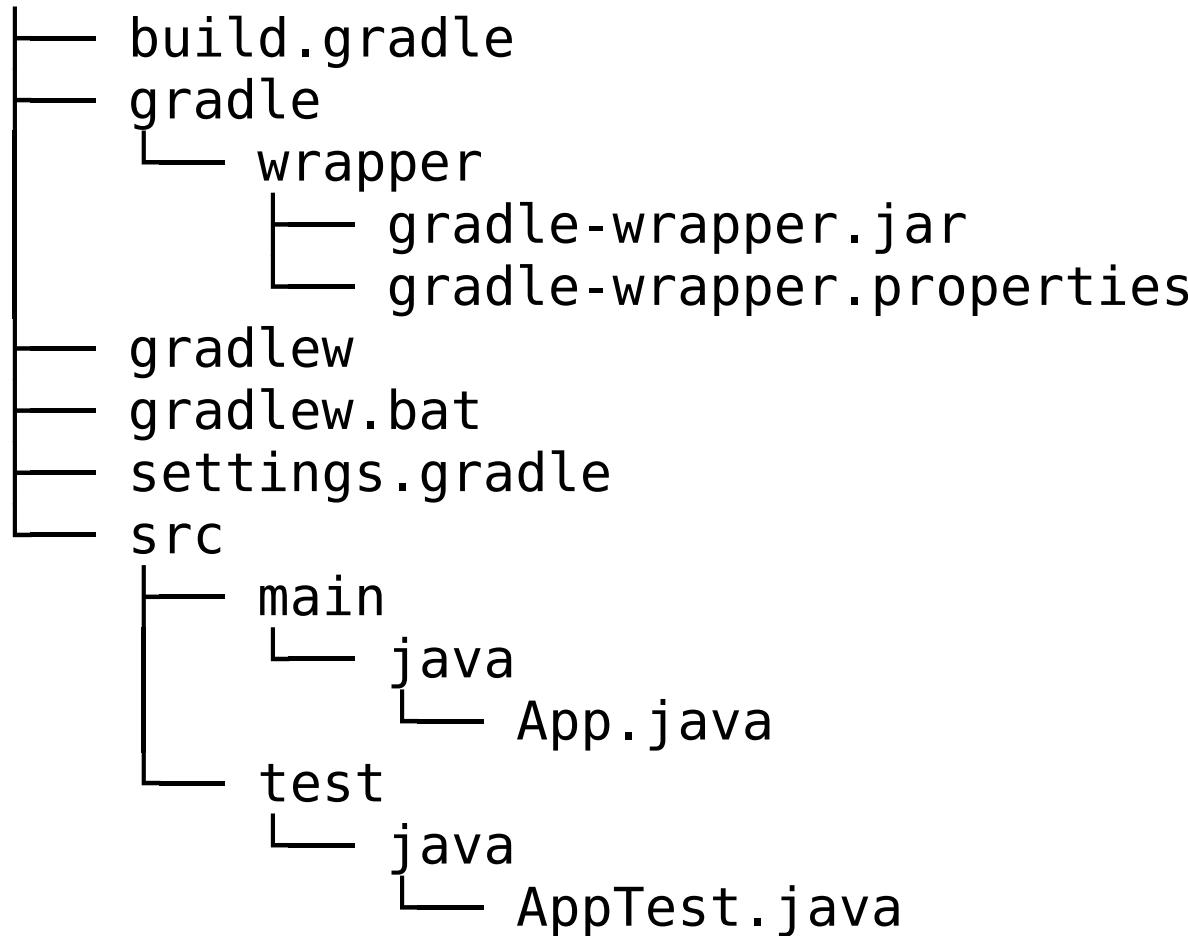

Gradle

Gradle

- <https://gradle.org/>
- similar to Maven
 - the same repositories for dependencies
 - but own language for project specification
 - DSL v Groovy
 - DSL v Kotlin
- support for multiple languages/environments
 - Java, Android, Groovy, Scala, Kotlin, C++

Project structure

- gradle init --type java-application

Gradle

- gradle build
- gradle run
- ...
- gradle tasks
 - a list of possible tasks
