

Java

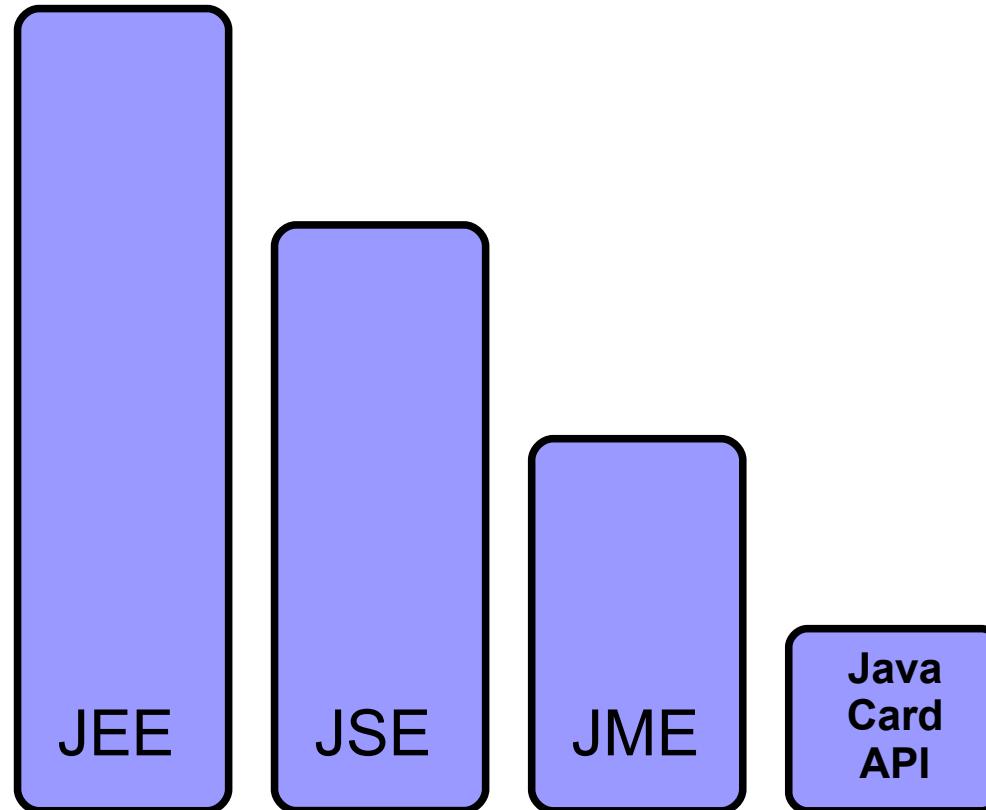

Platforms, etc.

Historie

- JDK 1.0 – 1996
- JDK 1.1 – 1997
 - Inner classes
- Java 2 platform – 2000
 - JDK 1.2, 1.3 – changes in libraries only
- JDK 1.4 – 2002
 - Assert
- JDK 5.0 – 2004
 - changes in the language
 - generics
 - annotations
 - ...
- JDK 6 – 2006
- JDK 7 – 2011 – „small“ changes in the language
- JDK 8 – 2014 – lambdas,...
- JDK 9 – 2017 – modules
- JDK 10 – 2018 – local variables type inference (var)
- JDK 11 – 2018 – extended usage of var
 - std library reduction
 - long-term support
- JDK 12 – 2019? – extended switch (usage as an expression,...)

Java platform

- JSE – standard edition
- JEE – enterprise edition
- JME – micro edition

Performance

- originally (~ JDK 1.1, 1998)
 - Java programs 6 times slower than C
- now:
 - Just-In-Time (JIT) compilation
 - during launching the program is compiled to native code
 - native code is executed
 - slow start, then fast
- performance ~ comparable with native applications
- big memory consumption

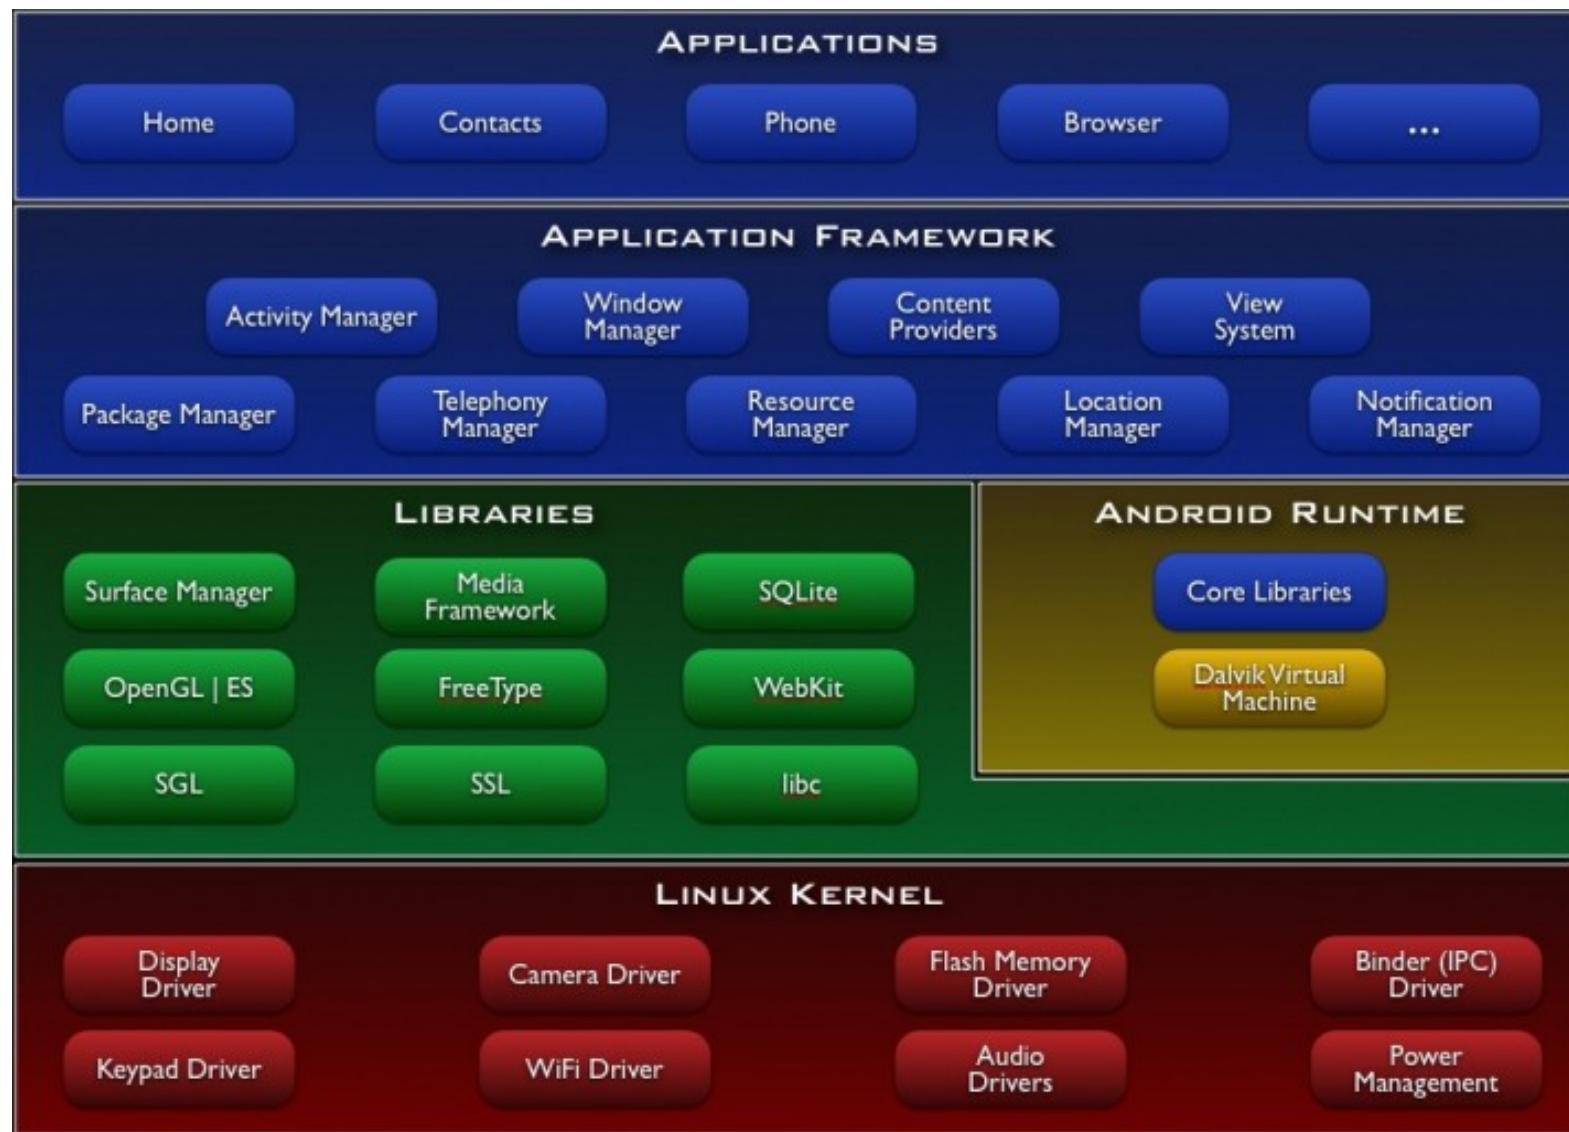

Java implementations

- Oracle (Sun Microsystems)
 - "official" implementation
 - Windows, Solaris, Linux, macOS
- OpenJDK
 - <http://openjdk.java.net/>
 - open-source
 - supported by Oracle (Sun Microsystems)
 - official implementation created from OpenJDK
- IBM
 - IBM JDK
 - 2017 => Eclipse OpenJ9 – open-source

Java implementations

- Jikes RVM
 - Research Virtual Machine
 - open-source
 - for testing extensions
 - written in Java
 - "self-hosting"
 - does need another JVM to run
 - boot-image writer
 - a Java program, which is executed in an existing JVM
 - boot-image loader
 - a program written in C++
 - does not support complete Java API

Android

source: <http://developer.android.com/>

Bck2brwsr

- <http://wiki.apidesign.org/wiki/Bck2Brwsr>
- Java running in a browser
- Project goals
 - „Create small Java capable to boot fast and run in 100% of modern browsers including those that have no special support for Java.“
 - Demonstrate that Java has benefits over JavaScript when creating larger HTML5 applications“
 - ...

JAVA

History and future

Changes in the language – Java 5

- static import
- auto-boxing and auto-unboxing
- new **for** cycle
- generics
- **enum**
- methods with variable number of parameters (printf)
- annotations (metadata)

Java 7

- changes
 - changes in syntax
 - support for dynamic languages (a new instruction in bytecode)
 - changes in NIO
 - Nimbus (Swing LaF)
 - new version of JDBC
 - ...

Java 7 – changes in syntax

- expressing constants
 - binary constants
 - `0b010101`
 - underscores in numerical literals
 - `1_000_000`
- String type in the switch

```
String month;  
...  
switch (month) {  
    case "January":  
    case "February":  
    ...  
}
```

Java 7 – changes in syntax

- operator <>

- simplified instantiation of generics
 - type in <> is automatically inferred
 - ex.

```
List<String> list = new ArrayList<>();  
List<List<String>> list = new ArrayList<>();  
List<List<List<String>>> list =  
    new ArrayList<>();  
Map<String, Collection<String>> map =  
    new LinkedHashMap<>();
```

- question

Why <> is necessary? I.e. why is not sufficient

```
List<String> list = new ArrayList();
```

Java 7 – changes in syntax

- the interface **AutoClosable** and extended **try**

– ex:

```
class Foo implements AutoClosable {  
    ...  
    public void close() { ... }  
}  
  
try ( Foo f1 = new Foo(); Foo f2 = new Foo() ) {  
    ...  
} catch (...) {  
    ...  
} finally {  
    ...  
}
```

- at the end of **try** (normally or by an exception), **close()** is always called on all the objects in the **try** declaration
- called in the reverse order than declared

Java 7 – changes in syntax

- multi- **catch** for several exceptions

- ex:

```
try {  
    ...  
} catch (Exception1 | Exception2 ex) {  
    ...  
}
```

- better type control during **re-throw**

Is the following code correct

```
private void foo(int i) throws Ex1, Ex2 {  
    try {  
        if (i < 0) {  
            throw new Ex1();  
        } else {  
            throw new Ex1();  
        }  
    } catch (Exception ex) {  
        throw ex;  
    }  
}
```

- in Java 7 **yes**
- in Java 6 no
 - the compiler prints out an error here

Java 8

- type annotations
 - type use can be annotated
 - repeating annotations
- default and static methods in interfaces
- lambda expressions
- generic type inference
- profiles
 - a “subset” of the std library
 - javac -profile ...

Java 9 – modules

- Module
 - named and self-describing collection of packages with types (classes,...) a data

- declares
 - dependences (required modules)
 - provided packages

module-info.class

```
module com.foo.bar {  
    requires com.foo.baz;  
    exports com.foo.bar.alpha;  
    exports com.foo.bar.beta;  
}
```

Java 9 – modules

- JSE platform – divided into a set of modules

```
module java.base {  
    exports java.io;  
    exports java.lang;  
    exports java.lang.annotation;  
    exports java.lang.invoke;  
    exports java.lang.module;  
    exports java.lang.ref;  
    exports java.lang.reflect;  
    exports java.math;  
    exports java.net;  
    ...  
}
```

Java 10

- local variables type inference

```
var s = "hello";
var list = new ArrayList<String>();
```

- var – reserved type name
- it is not a keyword
- requires initialization

Java 11

- the var type-inferencing for lambda parameters

Java

Generics

Introduction

- *similar* to the templates in C#/C++
 - **but only on first view**
- typed arguments
- goal
 - clear code
 - type safety

Motivational example

- without generics (<=Java 1.4)

```
List myIntList = new LinkedList();
myIntList.add(new Integer(0));
Integer x = (Integer)myIntList.iterator().next();
```

- >= Java 5

```
List<Integer> myIntList = new LinkedList<Integer>();
myIntList.add(new Integer(0));
Integer x = myIntList.iterator().next();
```

- no explicit casting
- type checks during compilation

Definition of generics

```
public interface List<E> {  
    void add(E x);  
    Iterator<E> iterator();  
    E get(int i);  
}  
public interface Iterator<E> {  
    E next();  
    boolean hasNext();  
}
```

- **List<Integer> can be seen as**

```
public interface IntegerList {  
    void add(Integer x);  
    Iterator<Integer> iterator();  
}
```

- **but in reality no such code exists**
 - no code is generated as in C++

Type relations

- no changes in typed arguments are allowed

```
List<String> ls = new ArrayList<String>();  
List<Object> lo = ls;
```

```
lo.add(new Object());  
String s = ls.get(0);
```

error – assigning Object to String

- second line causes compilation error
- List<String> is not subtype of List<Object>

Type relations

- example – printing all elements in a collection
<= Java 1.4

```
void printCollection(Collection c) {  
    Iterator i = c.iterator();  
    for (k = 0; k < c.size(); k++) {  
        System.out.println(i.next());  
    }  
}
```

naive attempt in Java 5

```
void printCollection(Collection<Object> c) {  
    for (Object e : c) {  
        System.out.println(e);  
    }  
}
```

- does not work (see the previous example)

Type relations

- Collection<Object> **is not supertype of all collections**
- **correctly**

```
void printCollection(Collection<?> c) {  
    for (Object e : c) {  
        System.out.println(e);  
    }  
}
```

- Collection<?> **is supertype of all collections**
 - collection of unknown
 - any collection can be assigned there
- **BUT – to Collection<?> nothing can be added**

```
Collection<?> c = new ArrayList<String>();  
c.add(new Object());
```

<= compilation error
- get () can be called – return type is Object

Type relations

- ? - wildcard
- bounded wildcard

```
public abstract class Shape {  
    public abstract void draw(Canvas c);  
}  
public class Circle extends Shape { ... }  
public class Canvas {  
    public void drawAll(List<Shape> shapes) {  
        for (Shape s:shapes) {  
            s.draw(this)  
        }  
    } }
```

- can draw lists of the type `List<Shape>` only but not
e.g. `List<Circle>`

Type relations

covariant

- solution – bounded ?

```
public void drawAll(List<? extends Shape> shapes) {  
    for (Shape s:shapes) {  
        s.draw(this)  
    } }
```

- but still you cannot add to this List

```
shapes.add(0, new Rectangle()); compilation error
```

Generic methods

```
static void fromArrayToCollection(Object[] a,  
Collection<?> c) {  
    for (Object o : a) {  
        c.add(o); ← compilation error  
    }  
}
```

```
static <T> void fromArrayToCollection(T[] a,  
Collection<T> c) {  
    for (T o : a) {  
        c.add(o); ← OK  
    }  
}
```

Generic methods

- usage
 - the compiler determines actual types automatically

```
Object[] oa = new Object[100];
Collection<Object> co = new ArrayList<Object>();
fromArrayToCollection(oa, co); // T → Object
String[] sa = new String[100];
Collection<String> cs = new ArrayList<String>();
fromArrayToCollection(sa, cs); // T → String
fromArrayToCollection(sa, co); // T → Object
```

- bounds can be used with methods also

```
class Collections {
    public static <T> void copy(List<T> dest, List<?
        extends T> src) { ... }
}
```

Type inference

- compiler cannot always determine the type
 - example

```
class Collections {  
    static <T> List<T> emptyList();  
    ...  
}
```

- `List<String> listOne = Collections.emptyList();`
 - OK
- `void processStringList(List<String> s) {
 ...
}`
`processStringList(Collections.emptyList());`
 - cannot be compiled (in Java 7)

Type inference

- we can provide “help” to the compiler
 - `processStringList(Collections.<String>emptyList());`
- since Java 8 the example can be compiled without the “help”
 - better type inference

Generic methods and ?

- when use generic methods and when wildcards

```
interface Collection<E> {  
    public boolean containsAll(Collection<?> c);  
    public boolean addAll(Collection<? extends E> c);  
}
```

```
interface Collection<E> {  
    public <T> boolean containsAll(Collection<T> c);  
    public <T extends E> boolean addAll(Collection<T>  
        c);  
}
```

- What is better?

Generic methods and ?

- when use generic methods and when wildcards

```
interface Collection<E> {  
    public boolean containsAll(Collection<?> c);  
    public boolean addAll(Collection<? extends E> c);  
}
```

```
interface Collection<E> {  
    public <T> boolean containsAll(Collection<T> c);  
    public <T extends E> boolean addAll(Collection<T>  
        c);  
}
```

- generic methods – relations among several types

Generic methods and ?

- it is possible to use both generic methods and wildcards together

```
class Collections {  
    public static <T> void copy(List<T> dest,  
                                List<? extends T> src) {....}  
}
```

- it can be also written as

```
class Collections {  
    public static <T, S extends T>  
        void copy(List<T> dest, List<S> src) {....}  
}
```

- first variant is “correct”

Array and generics

- array of generics
 - can be declared
 - cannot be instantiated

```
List<String>[] lsa = new List<String>[10]; wrong  
List<?>[] lsa = new List<?>[10]; OK + warning
```

- why? arrays can be cast to Object

```
List<String>[] lsa = new List<String>[10];  
Object[] oa = (Object[]) o;  
List<Integer> li = new ArrayList<Integer>();  
li.add(new Integer(3));  
oa[1] = li;  
String s = lsa[1].get(0); ClassCastException
```

“Old” and “new” code

- “old” code without generics

```
public class Foo {  
    public void add(List lst) { ... }  
    public List get() { ... }  
}
```

- “new” code that uses the “old” one

```
List<String> lst1 = new ArrayList<String>();  
Foo o = new Foo();  
o.add(lst1); ← OK - List corresponds to List<?>  
List<String> lst2 = o.get(); ← compilation warning
```

“Old” and “new” code

- “new” code with generics

```
public class Foo {  
    public void add(List<String> lst) { ... }  
    public List<String> get() { ... }  
}
```

- “old” code that uses the “new” one

```
List lst1 = new ArrayList();  
Foo o = new Foo();  
o.add(lst1); ← compilation warning  
List lst2 = o.get(); ← OK - List corresponds to List<?>
```

"Erasur"e

```
public String loophole(Integer x) {  
    List<String> ys = new LinkedList<String>();  
    List xs = ys;  
    xs.add(x);           ← warning  
    return ys.iterator().next();  
}
```

- at runtime, it behaves as

```
public String loophole(Integer x) {  
    List ys = new LinkedList();  
    List xs = ys;  
    xs.add(x);  
    return (String)ys.iterator().next(); ← runtime error  
}
```

"Erasure"

- during compilation, all information about generic types are erased
 - "erasure"
 - type parameters are erased (`List<Integer> → List`)
 - type variables are replaced by the most common type
 - casts added

Code of generic classes

```
List<String> l1 = new ArrayList<String>();  
List<Integer> l2 = new ArrayList<Integer>();  
System.out.println(l1.getClass() == l2.getClass());
```

- What is printed out?
 - a) true
 - b) false

Code of generic classes

```
List<String> l1 = new ArrayList<String>();  
List<Integer> l2 = new ArrayList<Integer>();  
System.out.println(l1.getClass() == l2.getClass());
```

- What is printed out?
 - a) true
 - b) false

Casts, instanceof

```
Collection cs = new ArrayList<String>();  
if (cs instanceof Collection<String>) . . . .
```

- **impossible**

```
Collection<String> cstr = (Collection<String>) cs;  
- warning  
- cannot be obtain at runtime
```

```
<T> T badCast(T t, Object o) {return (T) o; }  
- warning
```

```
<T> T[] makeArray(T t) {  
    return new T[100];           ← impossible  
}
```

Additional type relations

```
class Collections {  
    public static <T> void copy(List<T> dest, List<?  
        extends T> src) {...}  
}
```

contravariant

- actual declaration is

```
class Collections {  
    public static <T> void copy(List<? super T> dest,  
        List<? extends T> src) {...}  
}
```

- it is possible to add to the `<? super T>` collection

Additional type relations

- super can be used with gen. methods only
- cannot be used with gen. types
 - would not bring anything

```
class Foo<T super Number > {  
    private T v;  
    public Foo(T t) { v = t; }  
}
```

- after erasure

```
class Foo {  
    private Object v;  
    public Foo(Object t) { v = t; }  
}
```

- it would only guarantee that as a parameter a supertype of Number can be used
 - it would not guarantee that in the variable is always an instance of a supertype of Number

Converting "old" code to new

```
interface Comparator<T>
    int compare(T fst, T snd);
}
```

```
class TreeSet<E> {
    TreeSet(Comparator<E> c)
    ...
}
```

- `TreeSet<String>`
 - it is possible to use both `Comparator<String>` and `Comparator<Object>`

→ `class TreeSet<E> {`
 `TreeSet(Comparator<? super E> c)`
 `...`
}

Converting "old" code to new

```
Collections {  
    public static <T extends Comparable<T>>  
        T max(Collection<T> coll);  
}
```

```
class Foo implements Comparable<Object> { ... }  
Collection<Foo> cf = ...  
Collections.max(cf)      does not work
```

- **correctly**

```
public static <T extends Comparable<? super T>>  
    T max(Collection<T> coll);
```

Converting "old" code to new

```
public static <T extends Comparable<? super T>>  
    T max(Collection<T> coll);
```

- **erasure**

- public static Comparable max(Collection coll)
 - is not compatible with the “old” metod max
 - public static Object max(Collection coll)

- **more correctly**

```
public static <T extends Object & Comparable<? super  
T>> T max(Collection<T> coll);
```

- **several type can be specified:** T1 & T2 & ... & Tn
 - “erasure” takes the first one

- **fully correctly**

```
public static <T extends Object & Comparable<? super  
T>> T max(Collection<? extends T> coll);
```

Java

Annotations

Overview

- annotations ~ metadata
 - “data about data”
 - additional information about a part of code, which does not (directly) influence program functionality
- since JDK 5
- examples
 - `@Deprecated`
 - `@SuppressWarnings`
 - `@Override`

Motivation for annotations

- in fact, annotations have existed before JDK 5
 - but were not defined systematically, and
 - could not be added (easily)
 - e.g.:
 - the modifier **transient**
 - @deprecated element in a javadoc comment
 - ...
- XDoclet
 - <http://xdoclet.sourceforge.net/>
 - adding annotations to “old” Java
 - as definable tags in javadoc comments
 - anything can be generated from them
 - contains many predefined tags and transformations
 - originally, it was a tool supporting development of EJB components

Usage

- annotations can be used in fact to any element of a program
 - classes
 - interfaces
 - fields
 - methods
 - constructors
 - packages
 - type usage (since Java 8)
- general rule
 - annotation can be used on places, where modifiers can be used
 - exception – annotations for packages (written to the special file **package-info.java**) and
 - type usage
- an annotation usage can be restricted

Usage

- e.g.:

```
class A {  
    @Override public boolean equals(A a) { ... }  
    @Deprecated public void myDeprecatedMethod() {  
        ...  
    }  
}
```

- annotations can have parameters

```
@SuppressWarnings("unchecked") public void foo() {
```

Usage

- annotation of type use (Java 8)
 - `new @Interned MyObject();`
 - `myString = (@NotNull String) str;`
 - `class UnmodifiableList<T> implements @readonly List<@readonly T> { ... }`
 - `void monitorTemperature() throws @Critical TemperatureException { ... }`

Usage

- can be used among modifiers in any order
 - common usage – first annotations, then modifiers
- any number of annotations can be used to a single element
- Java 5-7 – a single annotation **cannot** be applied several times to a single element
 - even if used with different parameters
- Java 8+ – a single annotation **can** be applied several times to a single element

Definition

- similarly to interfaces
 - `@interface`
 - methods without implementation
- e.g.

```
public @interface RequestForEnhancement {  
    int id();  
    String synopsis();  
    String engineer() default "[unassigned]";  
    String date()      default "[unimplemented]";  
}
```

Definition

- “special” annotations
- marker
 - no body
 - no parameters when annotation is used
 - `public @interface Preliminary { }`
- single-member
 - a single method named **value**
 - any type
 - when used, only annotation and parameter value is written
 - `public @interface Copyright { String value(); }`

Definition

- usage of the previous annotations

```
@RequestForEnhancement(
    id      = 2868724,
    synopsis = "Enable time-travel",
    engineer = "Mr. Peabody",
    date     = "4/1/3007"
)
public static void travelThroughTime(Date destination)
{ ... }

@Preliminary public class TimeTravel { ... }

@Copyright("2002 Yoyodyne Propulsion Systems")
public class OscillationOverthruster { ... }
```

Definitions

- same as for interfaces
 - place of declaration
 - scope validity
 - scope of visibility
- must not be a generic type
- must not contain extends
 - by default the extends **java.lang.annotation.Annotation**
- any number of methods
- annotation T must not contain a method returning T
 - directly but also indirectly

```
@interface SelfRef { SelfRef value(); }
@interface Ping { Pong value(); }
@interface Pong { Ping value(); }
```

Definition

- methods must not have any parameters
- methods must not be generic
- methods must not declare throws
- returning value must be either:
 - primitive type
 - String
 - Class
 - Enum
 - annotations
 - array of the types above

Definition

- when used, annotation must contain a tuple name-value for each method
 - does not hold for methods with default value
- values must not be **null**

Pre-defined annotations

- annotations for usage on annotations
 - restrict usage of the annotation
 - in package `java.lang.annotation`
- **@Target**
 - single-member
 - restricts applicability of the annotation
 - possible values (enum `ElementType`)
 - `ANNOTATION_TYPE`
 - `CONSTRUCTOR`
 - `FIELD`
 - `LOCAL_VARIABLE`
 - `PACKAGE`
 - `METHOD`
 - `PARAMETER`
 - `TYPE` – can be used on class, interface, enum, annotation
 - `TYPE_PARAMETER` – since Java 8
 - `TYPE_USE` – since Java 8
 - `MODULE` – since Java 9

Pre-defined annotations

- **@Retention**
 - single-member
 - defines when the annotation can be used
 - possible values (enum RetentionPolicy)
 - SOURCE – source code only
 - CLASS – at compiler time
 - RUNTIME – at run-time

```
@Retention(RetentionPolicy.RUNTIME)
public @interface Foo { }
```

Repeating annotations

- since Java 8

```
@Schedule(dayOfMonth="last")
@Schedule(dayOfWeek="Fri", hour="23")
public void foo() { ... }
```

- for compatibility reasons, repeating annotations are stored in an automatically generated container
 - the container has to be prepared

```
@Repeatable(Schedules.class)
public @interface Schedule { ... }

public @interface Schedules {
    Schedule[] value;
}
```

Obtaining annotations at runtime

- via Reflection API
- the interface AnnotatedElement
 - isAnnotationPresent – if an annotation present
 - getAnnotation – returns annotation of the given type, if it is applied
 - getAnnotations – returns all annotations
 - getDeclaredAnnotations – returns declared annotations (without inherited)

Processing SOURCE annotations

- annotation processors
 - specified to the compiler
 - the parameter **-processor**
 - **javax.annotation.processing.Processor**
 - since Java 6
- Annotation Processing Tool (APT)
 - an external tool for annotation processing
 - Java 5
 - since JDK 8 – APT and corresponding API marked as deprecated

Example – Unit Testing

```
import java.lang.annotation.*;
@Retention(RetentionPolicy.RUNTIME)
@Target(ElementType.METHOD)
public @interface Test { }

public class Foo {
    @Test public static void m1() {
        ...
    }
    public static void m2() {
        ...
    }
    @Test public static void m3() {
        ...
    }
}
```

Example – Unit Testing

```
import java.lang.reflect.*;
public class RunTests {
    public static void main(String[] args)
                    throws Exception {
        int passed = 0, failed = 0;
        for (Method m :
                Class.forName(args[0]).getMethods()) {
            if (m.isAnnotationPresent(Test.class)) {
                try {
                    m.invoke(null);
                    passed++;
                } catch (Throwable ex) {
                    System.out.printf("Test %s
                                      failed: %s %n", m, ex.getCause());
                    failed++;
                }
            }
        }
        System.out.printf("Passed: %d,
                          Failed %d%n", passed, failed);
    }
}
```
