Research methods

Human-computer interaction

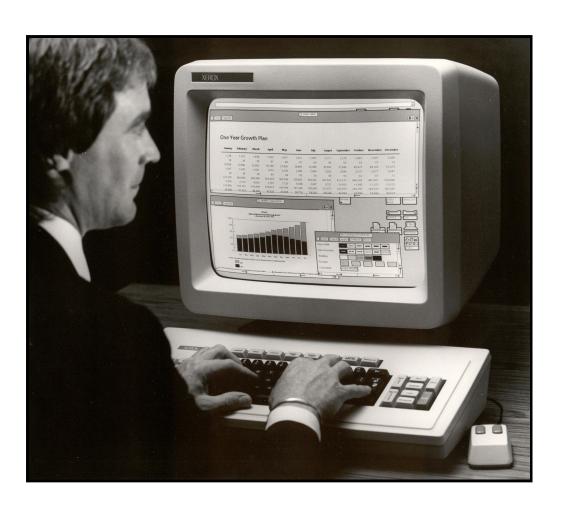

HCI perspective

Are programming languages user interfaces?

The means by which the user and a computer system interact (...)

Shifts focus on users and interaction

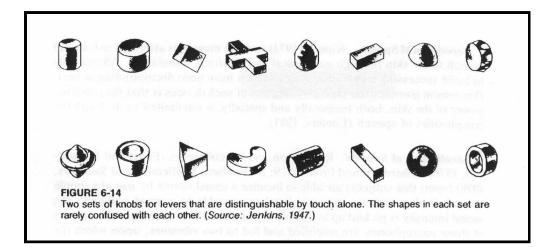

Desktop metaphor

Created in the 1970s at Xerox

Metaphor as a design principle

Move from solving problems to building new interfaces

Human factors

Equipment interaction incidents by trained users in World War II

Design equipment to minimize potential for problems

Lab testing and experimental psychology

Research methods

What to study and how

- What is the most effective way of doing X?
- What mistakes programmers make and why?
- T Can we solve X and Y in a unified way?
- Do systems enable new user experiences?

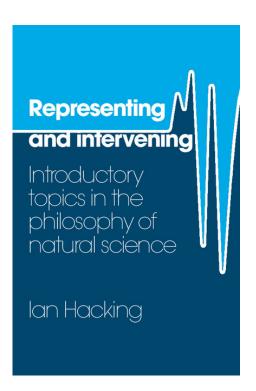

Methodological bias

Hierarchy in science

- Theoreticians over experimentalists
- Everyone knows Einstein's equation
- Nobody Michelson-Morley experiment

Biases in computing

- Proofs are the most fundamental!
- Can we measure something objective?
- Running a rigorous user experiment?
- All other evaluation is "too soft"!

Controlled experiments

Evidence-based language design

```
char
                                                          _3141592654\[3141
         ],__3141[3141];_314159[31415],_3141[31415];main(){register char*

```

Evidence-based language design

For each language feature, determine the best option experimentally

How to make user studies as rigorous as possible?

Randomized controlled trials

Gold standard in medicine

- Compare treatments or with placebo
- Random allocation of participants
- Blinding and study pre-registration

Limitations of RCTs

- Very hard to do properly
- Answers only very limited questions
- Even this may not be rigorous enough!

Case study: Perl vs. Randomo

```
action Main
 number x = z(1, 100, 3)
action z(integer a, integer b,
  integer c) returns number
 number d = 0.0
 number e = 0.0
 integer i = a
 repeat b - a times
  if i \mod c = 0 then
    d = d + 1
  end
  else then
    e = e + 1
  end
  i = i + 1
 end
 if d > e then
  return d
 end
 else then
  return e
 end
end
```

```
$x = &z(1, 100, 3);
sub z{
 $a = $_{0};
 $b = $_[1];
 $c = $_{2};
 $d = 0.0;
 $e = 0.0;
 for (\$i = \$a; \$i <= \$b; \$i++) {
  if ($i % $c == 0) {
    $d = $d + 1;
  else {
    $e = $e + 1;
 if ($d > $e) {
  $d;
 else {
   $e;
              (b) Perl
```

(a) Quorum

(c) Randomo

An Empirical Investigation into Programming Language Syntax (Steffik, Siebert, 2013)

Getting it right

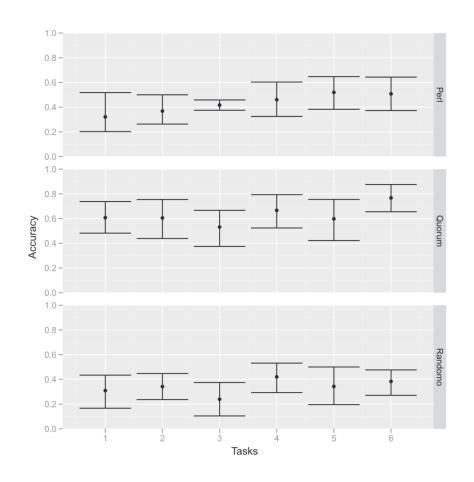

Study setup

- Copy and modify code sample
- Never programmed before
- Age, gender, language balance

Statistical evaluation

- Verified manual rating of accuracy
- Mauchly's sphericity test
- Repeated-measures ANOVA test

Perl vs. Randomo

While users of Quorum were able to program statistically significantly more accurately than users of Perl (p = .047), and users of Randomo (p = .004), Perl users were not able to program significantly more accurately than Randomo users (p = .458).

Experiments

Studying languages experimentally

- ≠ Typing discipline, syntax, errors, inheritance
- Ocompare two structurally similar alternatives
- Study participants with similar backgrounds
- Does not help with fundamentally new designs

Empirical studies

Software repository analysis

Software repository analysis

Study existing codebases

- Lots of projects on GitHub
- Commit history, bug reports, etc.

What can we study?

- What leads to fewer bugs?
- How OSS contributors behave
- How code gets duplicated and reused?
- Code quality and code structure

A Large Scale Study of Programming Languages and Code Quality in Github

Baishakhi Ray, Daryl Posnett, Vladimir Filkov, Premkumar Devanbu (bairay@, dposnett@, filkov@cs., devanbu@cs.)ucdavis.edu Department of Computer Science, University of California, Davis, CA, 95616, USA

ABSTRACT

What is the effect of programming languages on software quality? This question has been a topic of much debate for a very long time. In this study, we gather a very large data set from GitHub (729 projects, 80 Million SLOC, 29,000 authors, 1.5 million commits, in 17 languages) in an attempt to shed some empirical light on this question. This reasonably large sample size allows us to use a mixed-methods approach, combining multiple regression modeling with visualization and text analytics, to study the effect of language features such as static v.s. dynamic typing, strong v.s. weak typing on software quality. By triangulating findings from different methods, and controlling for confounding effects such as team size, project size, and project history, we report that language design does have a significant, but modest effect on software quality. Most notably, it does appear that strong typing is modestly better than weak typing, and among functional languages, static typing is also somewhat better than dynamic typing. We also find that functional languages are somewhat better than procedural languages. It is worth noting that these modest effects arising from language design are overwhelmingly dominated by the process factors such as project size, team size, and commit size. However, we hasten to caution the reader that even these modest effects might quite possibly be due to other, intangible process factors, e.g., the preference of certain personality types for functional, static and strongly typed

Categories and Subject Descriptors

D.3.3 [PROGRAMMING LANGUAGES]: [Language Constructs and Features]

General Terms

Measurement, Experimentation, Languages

Keywords

programming language, type system, bug fix, code quality, empirical research, regression analysis, software domain

1. INTRODUCTION

A variety of debates ensue during discussions whether a given programming language is "the right tool for the job". While some of these debates may appear to be tinged with an almost religious fervor, most people would agree that a programming language can impact not only the coding process, but also the properties of the resulting artifacts.

Advocates of strong static typing argue that type inference will cards software logs early. Advocates of dynamic typing may argue that rather than spend a lot of time correcting annoying static type errors arising from sound, conservative static type checking algorithms in compilers, it's better to rely on strong dynamic typing to catch errors as and when they arise. These debates, however, have largely been of the armchair variety; usually the evidence offered in support of one position or the other tends to be anecdotal.

Empirical evidence for the existence of associations between code quality programming language choice, language properties, and usage domains, could help developers make more informed choices.

Given the number of other factors that influence software enineering outcomes, obtaining such evidence, however, is a challenging task. Considering software quality, for example, there are a number of well-known influential factors, including source code size [8], the number of developers [29, 3], and age/maturity [23]. These factors are known to have a strong influence on software quality, and indeed, such process factors can effectively predict defect localities [29].

One approach to teasing out just the effect of language properties, even in the face of such daunting confounds, is to do a controlled experiment. Some recent works have conducted experiments in controlled settings with takes of limited scope, with students, using languages with static or dynamic typing (based on experimental treatment setting) [1]; 7, [5]. While type of controlled study is "BL Canino Read" to sold empirical evidence, another opportunity has recently arisen, thanks to the large number of open source projects collected in software forges such as GitHub.

Gitthub contains many projects in multiple languages. These projects vary a great deal across size, age, and number of developers. Each project tepository provides a historical record from which we extract project data including the contribution history, project size, authorship, and defect repair. We use this data to determine the effects of language features on defect occurrence using a variety of tools. Our approach is best described as mixed-methods, or tri angulation [7] approach in death of the described as mixed analysis, clustering, and visualization. The observations from the mixed methods leadingly confirm the findings of the quantitative study.

Does strong typing matter?

Large scale corpus study

"[It] appear[s] that "strong typing is modestly better than weak typing, and among functional languages, static typing is also somewhat better than dynamic typing.""

Software

Boffins debunk study claiming certain languages (cough, C, PHP, JS...) lead to more buggy code than others

Hard evidence that some coding lingo encourage flaws remains elusive

By Thomas Claburn in San Francisco 30 Jan 2019 at 21:45 154 ☐ SHARE ▼

Tempting through it may be to believe that certain programming languages promote errors, recent research finds little if any evidence of that.

A scholarly paper, "A Large Scale Study of Programming Languages and Code Quality in Github," presented at the 2014 Foundations of Software Engineering (FSE) conference, made that claim that some computer languages show higher levels of buggy code, setting off a firestorm of developer comment.

Does strong typing matter?

Attempt to reproduce the study mostly failed

"I believe [it does] in my heart of hearts, but it's kind of an impossible experiment to run."

Repository analysis

How to and limitations

- Lots of code on GitHub is useless
- Focus on somewhat sensible projects!
- Many hidden factors to account for
- Avoid comparing apples and oranges
- Studying semantics and runtime is hard

Usability evaluation

Considered harmful

Cultural adoption

(Greenberg et al. 2008)

"Usability evaluation is appropriate for settings with well-known tasks and outcomes. They fail to consider how novel systems will evolve and be adopted by a culture over time."

Tricky to evaluate

Early designs

- Purely explorative sketches
- Getting the right design vs.
 Getting the design right

Cultural adoption

- Hard to imagine future uses
- First radio and automobiles
- Memex, Sketchpad and oNLine System

Evaluating user interface research

(Olsen, 2007)

Lively research field in the 1970s and 1980s

Ubiquitous computing challenges the classic desktop metaphor

Increasing number of non-expert programmers!

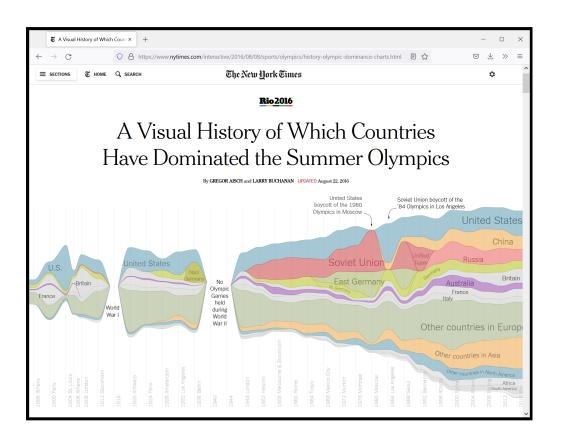

User interfaces

New system and languages

- Reduce time to create new solutions
- **B** Least resistance to good solutions
- Lowering skills barrier of users
- Power in common unified infrastructure

Simplifying programming

Data exploration tools

Programming for data journalists

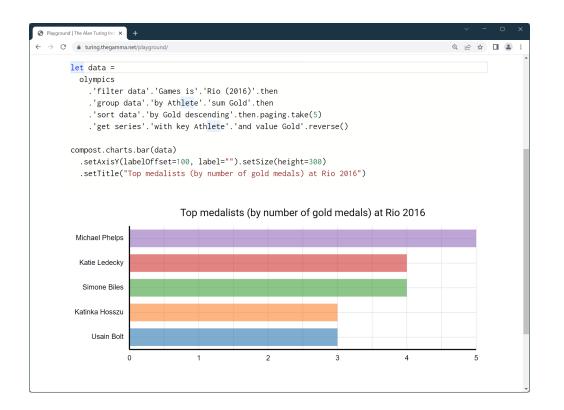

Data transformations using various online data sources

Too hard for Excel, too complex in Python or R

Getting it right is very time-consuming!

Demo

Data exploration in The Gamma

Evaluating The Gamma

Can non-experts actually use it?

Is it better than spreadsheets?

What desirable design characteristics does it have?

Case study: The Gamma

Evaluating programming systems

- Programming tool for journalists
- Olsen's framework for UI systems
- tinyurl.com/nprg075-ui

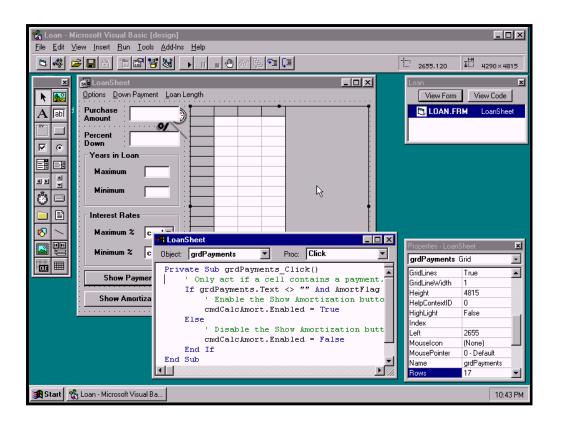

Design questions

- What possible claims can we make?
- What evaluation errors to avoid?

Methods review

Evaluating programming systems

Evaluating HCI toolkits

(Ledo et al., 2018)

Research claims made in publications about Ul toolkits, etc.

The same works for languages, libraries, tools, frameworks, ...

Evaluation types

What claims can we make?

- **B** Demonstrations show what is possible
- **Usage** study actual system use
- Performance evaluate how well it runs
- Heuristics expert rules of thumb

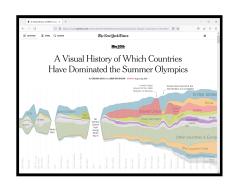

Demonstrations

Showing a novel example

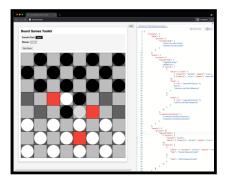

Can do something previously unthinkable

Replicating past examples

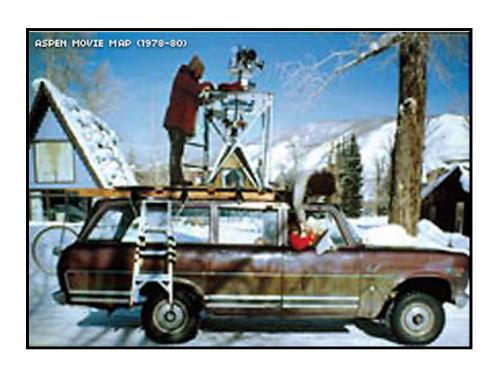

System makes previously very hard thing easy

Presenting case studies

Show usability of a system in a range of situations

Demo or Die!

MIT Media Lab paraphrasing of "publish or perish".

Aspen Movie Map
The 1978 precursor of
Google Street View

Demo of a radically new technology

Varv: Reprogrammable Interactive Software as a Declarative Data Structure

Marcel Borowski marcel.borowski@cs.au.dk Aarhus University Aarhus, Denmark

Janus Bager Kristensen jbk@cavi.au.dk Aarhus University Aarhus, Denmark Luke Murray lsmurray@mit.edu MIT CSAIL Cambridge, United States

Arvind Satyanarayan arvindsatya@mit.edu MIT CSAIL Cambridge, United States Rolf Bagge rolf@cavi.au.dk Aarhus University Aarhus, Denmark

Clemens N. Klokmose clemens@cs.au.dk Aarhus University Aarhus, Denmark

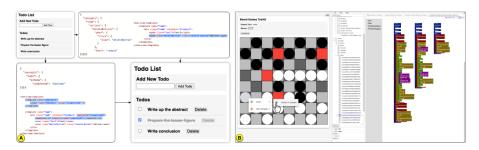

Figure 1: Varv Examples: (a) A todo list web application that is inherently extensible. Here, a basic todo list is extended with the ability to complete and delete todos by adding two new concept definitions and new modified template definitions. (b) A board game toolkit that defines abstractions for board game logic. The games "Checkers" and "Othello" were implemented with the toolkit and then merged into a new "Checkers-O-Thello" game with the addition of a short concept definition. As Varv applications are represented as data structures, higher-level tooling can be developed including a block-based editor (right), an inspector to go from an element in the view to the corresponding template or data (context menu to the left), and a data inspector for live editing application state (middle).

Varv programming system evaluation

(Borowski et al., 2022)

Makes all information visible and modifiable

Affects the whole developer workflow

Case studies to illustrate the effects

Vary evaluation

Demonstrate workflow

- Two concrete usage scenarios
- Step by step description of work
- Using personas for concreteness

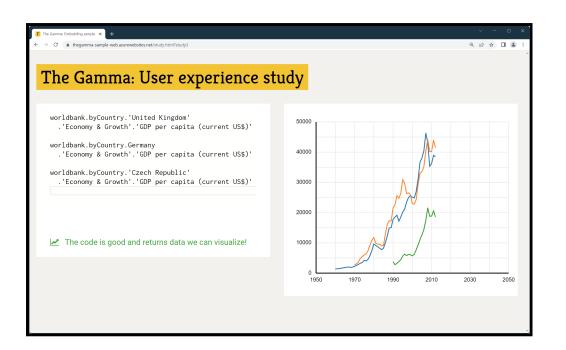

Inspector Foreign And production And product

(a) The UI Designer.

(b) The Computational Notebook.

Potential of the system

- Implications of the design
- Debugging, authoring, tools
- Notebooks, blocks, VS Code, etc.

Usage evaluation of The Gamma

(Petricek, 2022)

Can non-programmers really use the system?

Get non-programmers, ask them to try and watch and note!

	Task	Kind	Done	Notes
#1	expenditure	cube	•	Obtained one of two data series
#2	expenditure	cube	•	Explored furhter data series independently
#3	expenditure	cube	•	Explored further data series independently
#4	expenditure	cube	•	Completed following a hint to use another member
#5	expenditure	cube	•	Explored further data series independently
#6	worldbank	cube	•	Completed after a syntax hint about whitespace
#7	worldbank	cube	•	Completed very quickly
#8	worldbank	cube	•	Completed, but needed longer to find correct data
#9	lords	table	•	Struggled with composition of operations
#10	lords	table	•	Completed very quickly
#11	lords	table	•	With a hint to avoid operations taking arguments
#12	olympics	table	•	With a hint to avoid operations taking arguments
#13	olympics	table	•	With hints about 'then' and operations taking arguments

Table 1. Overview of work completed by individual participants in the study. The marks denote: \bullet = completed, \bullet = required some guidance, \bullet = partially completed

The Gamma evaluation

13 participants from business team of a research institute

Asked to complete 1 of 4 different tasks

Evaluated using activity logging, observation and interview

Usage evaluation

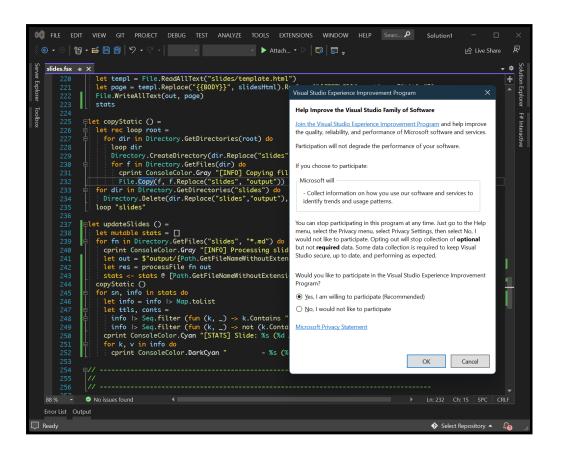

Possible setup

- Complete a given task
- Observe, log & record
- A/B comparison of variants
- In the lab or in the wild

Collecting feedback

- Complete a questionnaire
- Ask to comment (Think aloud)
- Semi-structured interview afterwards

Studying usage in the wild

Widely used to understand use of commercial systems

What language or editor features are used, performance, project profiles

Heuristics

Rules of thumb for evaluating designs written by experts

Evaluation without direct human involvement!

Example: Match between system and the real world

Olsen's criteria for user interface systems

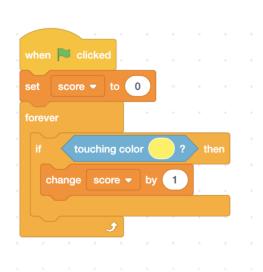

Heuristic evaluation

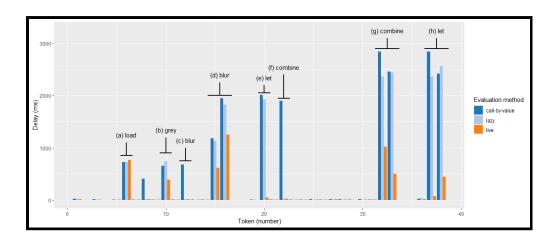

Nielsen's usability heuristics

- Characteristics of a good interface
- General usability guidelines
- Consistency, visibility of state, ...

Cognitive dimensions of notation

- Heuristics for assessing notations
- Broad-brush understandable evaluation
- Viscosity, visibility, abstraction, ...

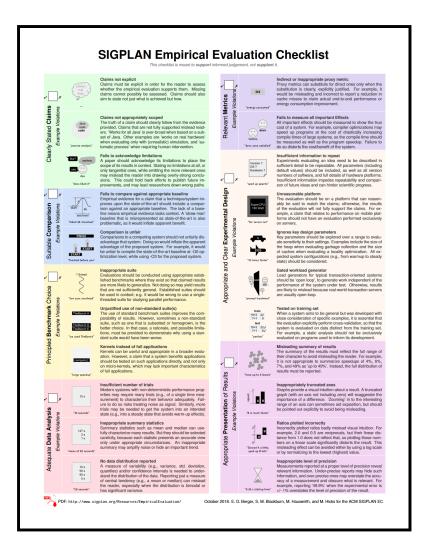

Technical performance

Baseline or improves over state of the art

Efficiency, lines of code

Not about usability, but an easy thing to show

Technical performance

Getting it right

Claims, comparison, benchmarks, metrices, setup, presentation
