Functional Testing (Testování funkčnosti)

http://d3s.mff.cuni.cz

Pavel Parízek

parizek@d3s.mff.cuni.cz

Software testing

- Checking whether a given program satisfies certain requirements and expectations about its behavior
- Basic idea
 - Pick specific inputs (a set of values)
 - Run the program for each input
 - Inspect the output and final state
- Shows only presence of errors
 - You can try just few selected input values

Terminology

- Test case
 - Checks single requirement on the program behavior
 - Defines test input and expected output (final state)
- Test suite
 - Collection of related test cases
- Fixture
 - Common environment for test cases in a given suite
- Test oracle
 - Determines whether the program behaves correctly
 - "Oracle problem": complex apps, user interface, automation

When to run tests

Development

- 1) Write code and some tests
- 2) Run all tests and find bugs
- 3) Fix bugs detected by tests
- 4) Go to step 1 until deadline

Regressions

- Execute all passed tests after every modification
 - bug fix, refactoring, new unrelated feature, optimization
- Goal: check whether everything still works then

Testing on different levels

Unit testing

- Small components (method, class)
- Automatic easily repeatable tests
- Provides clear answer (pass or fail)
- Integration testing
 - Checking interaction between components
- System testing (end-to-end)
 - Whole system in a target environment
 - Requirements specified by customers

Unit testing

- Developers write code that
 - Specifies test inputs and required properties
 - Checks whether all tests successfully passed
 - Comparing expected outputs (and program state) with actual outputs

- Frameworks
 - JUnit, TestNG, PyUnit, CPPUnit, Google Test, MSTest, NUnit, xUnit, and many others

JUnit

- https://github.com/junit-team/junit/wiki
- http://junit.org/junit5/

• Key features

- Test cases are normal Java methods
- Test suites are normal Java classes
- Results analyzed in an automated way

Versions

- JUnit 3.8.x: fixed method names, reflection
- JUnit 4.x/5.x: annotations

Simple test case

```
import java.util.*;
import org.junit.jupiter.api.Test;
import static org.junit.jupiter.api.Assertions.*;
public class TestArrayList {
  @Test
  public void add() {
    List al = new ArrayList();
    int origSz = al.size();
    al.add("abc");
    int newSz = al.size();
    assertEquals (origSz+1, newSz, "new != orig+1");
    assertTrue(al.contains("abc"));
```

Assert statements

- public static void assertXY ([message], ...)
- assertEquals(T expected, T actual)
- assertArrayEquals(T[] expected, T[] actual)
- assertSame(Object expected, Object actual)
- assertTrue(boolean condition)
- assertFalse(boolean condition)
- assertNull(Object obj)
- assertNotNull(Object obj)
- fail([String message])

Running tests

- Many options
 - Command line (java -cp ... <test runner>)
 - Build tools (Ant, Maven, Gradle, ...)
 - Popular IDEs (Eclipse, NetBeans, IntelliJ IDEA)
 - Warning: make sure you have a proper setup (various caches, libraries, classpath, ...)

- Information
 - https://junit.org/junit5/docs/current/userguide/#running-tests

What you should test

- Method contracts (API)
- All branches in the code
- All control-flow paths
- Special (corner) cases
 - "off by one", bad inputs
- Positive testing
- Negative testing
- Regressions
 - Inputs triggering previously discovered bugs

Task

- Unit tests for java.util.ArrayList
 - Selected methods: add(o), get(i), remove(i), remove(o), clear(), size(), contains(o)
- Try different assert statements
- Consider also some failing tests

- C#/.NET variant
 - ArrayList from the namespace System.Collections
 - List<T> from System.Collections.Generic

Department of Distributed and Dependable Systems

Software Development Tools Functional Testing 12

Fixture

- Set up a fixed environment for each test cases
- Reset before each test case isolated tests
- Initialization
 - @BeforeEach
 - @BeforeAll
- Clean-up
 - @AfterEach
 - @AfterAll

Test case with a simple fixture

```
import org.junit.jupiter.api.*;
public class TestArrayList {
  private List al;
  @BeforeEach
  public void setUp() {
    al = new ArrayList();
    al.add("abc");
  @AfterEach
  public void tearDown() {
    al = null;
  @Test
  public void add() { ... }
```

Expected exceptions

```
@Test
public void testSomething() {
  assertThrows(MyEx.class, () ->
            doSomeUnsafeOperation());
```

Task

- Practice defining of common fixtures
 - Extract duplicate initialization code

- Test against expected exceptions
 - get(i): IndexOutOfBoundsException

Recommended practice

- Place tests in the same package as target classes
 - Directory layout

```
src/main/cz/cuni/mff/myapp/MyClass.java
src/tests/cz/cuni/mff/myapp/TestMyClass.java
```

- Define single assertion in each test method
 - JUnit reports only the first failed assert in a test case
 - Multiple assertions → some failures possibly missed
 - Drawback: you need to write/produce lot more code

17

Parameterized tests

```
public class TestSquareRoot {
  public static Stream<Arguments> testData() {
    return Stream.of(
      arguments(1,1),
      arguments(4,2)
    );
  @ParameterizedTest
  @MethodSource("testData")
  public void test(int expOutput, int valInput) {
    assertEquals(expOutput, Math.sqrt(valInput));
```

Task

- Try different ways how to specify test data
 - https://junit.org/junit5/docs/current/userguide/#writing-tests-parameterized-tests

Advanced features of JUnit (4)

- Matchers
 - assertThat
- Assumptions
- Rules
 - TemporaryFolder
 - ErrorCollector
- Categories
- Further information
 - https://github.com/junit-team/junit/wiki

JUnit 5 – new features

- Framework decomposed into several modules
- Distributed through Maven central repository
- User guide
 - https://junit.org/junit5/docs/current/user-guide/
- New syntax of annotations
 - @BeforeEach vs @Before, @AfterEach vs @After
 - @BeforeAll vs @BeforeClass, @AfterAll
- New modern API
 - Classes and interfaces => different imports
 - Named assertions, grouping via assertAll
 - Syntax for parameterized tests (data source)

Testing methods

- Black-box testing
 - Zero knowledge about the implementation (no access)
 - Tests based only on specification and interfaces (API)
 - Checking outputs against expectations for input values
- White-box testing
 - Full knowledge of the implementation (access to code)
 - Tester can modify the system a little bit for easy testing
- Grey-box testing
 - Tester knows the system (code), but cannot modify it

22

Dependencies among objects

- Units typically have dependencies
 - Very hard to test such units in full isolation
 - Approach: complex fixtures and test cases
 - Example

```
@BeforeEach
public void setUp() {
   java.sql.Connection db = ... // complex init
   PersistenceMngr pm = new MyPersistenceMngr(db);
}
```

- Possible solutions
 - dummy objects, fake, stubs, mock objects

23

Dependencies among objects

- Dummy objects
 - Passed around but never used (e.g., parameter list)
- Fake
 - Working simpler implementation (e.g., in-memory DB)
- Stub
 - "empty" implementation with predefined responses to method calls

Mock object

Testing with mock objects

- Mock object
 - Stub that also checks whether it is used correctly by the object under test → "behavior verification"
- Frameworks
 - EasyMock (https://easymock.org/)
 - Mockito (https://site.mockito.org/)
 - Moq (<u>https://github.com/devlooped/moq</u>)
 - Rhino Mocks (https://hibernatingrhinos.com/oss/rhino-mocks)
 - Microsoft Fakes in Visual Studio
 - Only stubs, not full mocks
 - https://learn.microsoft.com/en-us/visualstudio/test/isolating-code-under-test-with-microsoft-fakes?view=vs-2022
 Department

25

Concurrency

- Testing does not work for concurrency
 - Programs with multiple threads

- Huge number of thread schedules
- Non-deterministic behavior
- Errors are hard to reproduce

Other artifacts and processes

- Configuration
- User interfaces

Complete user scenarios (end-to-end)

Unit testing for C#/.NET/Windows

- MSTest (Visual Studio)
 - Annotations: [TestClass], [TestMethod]
 - Fixture: [TestInitialize], [TestCleanup]
 - Basic assertion statements
 - Assert.AreEqual(Object, Object, String)
 - IsTrue, IsNotNull, IsInstanceOfType, Fail, ...
 - More advanced: StringAssert, CollectionAssert
 - Parameterized tests: [DataRow]
- Other frameworks
 - NUnit: https://github.com/nunit
 - xUnit.net: https://xunit.net/

Automation

- Generating tests with dynamic symbolic analysis
 - Manual writing of tests is very tedious
 - KLEE: http://klee.github.io/
 - IntelliTest: https://learn.microsoft.com/en-us/visualstudio/test/intellitest-manual/?view=vs-2022

Fuzzing techniques and tools

Fuzzing

- Search for inputs that may trigger some errors
 - Generating inputs [semi-] randomly (with constraints)
 - Visible failures: program crash, wrong output
- Useful for security bugs (critically important, hard-to-find)
- Interesting tools
 - SAGE & DART
 - Information and links: https://patricegodefroid.github.io/
 - AFL++ (Americal Fuzzy Loop): https://aflplus.plus/
 - JDart: https://github.com/psycopaths/jdart
 - OSS-Fuzz: https://github.com/google/oss-fuzz
- Literature
 - The Fuzzing Book (https://www.fuzzingbook.org/)
 - Fuzzing: Hack, Art, and Science. Communications of the ACM, Feb 2020
