

# Homework 3: Static Analysis

<http://d3s.mff.cuni.cz>

Department of  
Distributed and  
Dependable  
Systems

*Pavel Parízek*

CHARLES UNIVERSITY IN PRAGUE

faculty of mathematics and physics

# Task 1

- Design and implement a static analysis that finds whether the values of all object fields and local variables (of an integer type) stay in a given range
  - Value of any variable cannot exceed the upper bound and cannot fall below the lower bound
  - The range will be defined by the user as a configuration parameter of the analysis
    - For the purpose of this homework, it can be explicitly defined using constants in the procedure `main`
  - Consider only fields and variables declared in application classes
    - You can ignore those declared in libraries
  - Hint: note that you can have multiple elements of a bit-vector associated with every local variable (e.g., each bit representing one predicate about the variable)
- Use the WALA library for implementation

# Task 2

- Create some example programs to
  - Demonstrate your static analysis
  - Test its design and implementation

# Task 3

- Test various configurations of your analysis
  - For example, different numbers of bits dedicated to each variable or field
- Document your solution (analysis design, etc)
- Discuss precision-performance trade-offs
  - All you identify during experiments

# Organization

- Deadline: **24.5.2019**
- Submission
  - E-mail: **parizek@d3s.mff.cuni.cz**
