SMT Solvers, CBMC

http://d3s.mff.cuni.cz

Pavel Parízek

CHARLES UNIVERSITY IN PRAGUE
faculty of mathematics and physics
Z3

• SMT solver
  - theories: linear integer arithmetic, uninterpreted functions, arrays, bit vectors, ...
  - Input: SMT-LIB v2 (http://smtlib.cs.uiowa.edu/)

• Created by Microsoft Research

• Supports both Windows and Linux

• Source code & wiki: https://github.com/Z3Prover/z3

• Online interface: http://riseforfun.com/Z3
; comment: after the semicolon until the end of a line

; specify the logic to be used
(set-logic QF_UFLIA)

; condition that should hold
(assert (= c (+ a 2))) ; c == a + 2
(not P)
(and b1 b2)
(or ...)
(xor ...)

(+ a b c d)
(= a b)
(=> true false)
SMT-LIB: predicates and functions

; function symbol
(declare-fun Plus (Int Int) Int)

; predicate
(declare-fun Odd (Int) Bool)

; constant
(declare-fun a () Int)
(declare-const c Int) ; syntactic sugar
(declare-const a Int)
(declare-const b Int)
(declare-const c Int)

(assert (<= a b))
(assert (<= b c))
(assert (<= c a))
(assert (= 6 (+ a b c)))

; result: sat, unsat, unknown
(check-sat)

(get-model)
Task 1: Triangle puzzle

- **Goal**
  - Fill the circles with different numbers from 1-9
  - Keep the sum of numbers on every side equal to 17
Task 1: Triangle puzzle

(declare-const c1 Int)
...

; TODO you must add constraints on c1 ... c9 to get the solution

; all different
(assert (not (= c1 c2))) (assert (not (= c1 c3))) ...
(assert (not (= c2 c3))) ...
...

; get results
(check-sat)
(get-model)
(declare-const c1 Int)
...

; sums for edges
(assert (= 17 (+ c1 c2 c3 c4)))
(assert (= 17 (+ c4 c5 c6 c7)))
(assert (= 17 (+ c7 c8 c9 c1)))

; in-range check
(assert (< 0 c1))
(assert (> 10 c1))
...

; all different
(assert (not (= c1 c2))) (assert (not (= c1 c3))) ...
(assert (not (= c2 c3))) ...
...

; get results
(check-sat)
(get-model)
Kakuro puzzle

- **Goal**
  - Fill fields with numbers from 1-9
  - In a single row/column, the numbers may not repeat
  - Sums in the rows/columns must equal the specified number

```
  7  6
   4
7  __  __
6  __  __
```
Kakuro puzzle
int max(int a, int b) {
    int r;
    if (a < b) {
        r = b;
    }
    else { // a >= b
        r = a;
    }
    assert (a <= r && b <= r);
    return r;
}
How to encode programs using SMT

int max(int a, int b) {
    int r;
    if (a < b) {
        r = b;
    }
    else { // a >= b
        r = a;
    }
    assert (a <= r && b <= r);
    return r;
}

a = *, b = *
assert (a <= r && b <= r);
How to encode programs using SMT

```plaintext
a = *, b = *
r = *
if (a < b) {
    r = b;
}
else { // a >= b
    r = a;
}
assert (a <= r && b <= r);
```

```plaintext
(declare-const a Int)
(declare-const b Int)
(declare-const r Int)
(assert (or
        (and (< a b) (= r b))
        (and (>= a b) (= r a))
    ))
(assert (and (<= a r) (<= b r)))
(check-sat)
(get-model)
```
Variable assignments

```
int x = 0;

x = x + 1;

assert (x == 1);
```

```
(declare-const x1 Int)

(assert (= x1 0))

(assert (= x1 (+ x1 1)))

(assert (= x1 1))

(check-sat)

(get-model)
```
Variables have multiple versions

Static single assignment (SSA)

```plaintext
int x = 0;
x = x + 1;
assert (x == 1);
```

```plaintext
(declare-const x1 Int)
(declare-const x2 Int)

(assert (= x1 0))
(assert (= x2 (+ x1 1)))
(assert (= x2 1))
(check-sat)
(get-model)
```
Arrays

(declare-const c Int)
(declare-const a1 (Array Int Int))
(declare-const a2 (Array Int Int))
(assert (= c (select a1 10)))
(assert (= a2 (store a1 1 20)))
Bounded model checking

- Often used with SAT (propositional logic)
  - Q: Why?
  - Limited expressiveness: no “+” and “-”

- Q: How to encode statements like $x = a + b$?
Integer addition in HW/CPU

CBMC: how to use it

- Download
  - http://www.cprover.org/cbmc/download/cbmc-5-4-win.zip

- Run from the Visual Studio Command Prompt
  - Why: correctly initialized environment

- Examples
  - http://d3s.mff.cuni.cz/teaching/program_analysis_verification/files/bmc-examples.zip
Q: Exists an integer value $x$ such that $x \neq 0$ and $x = -x$?

Source code: ex01-ints.c
  Q: Is the program safe or not?

Find the answer using CBMC
  cbmc64 bmc-examples\ex01-ints.c
CBMC: example 2

- Program ex02-loops.c
  - Loop with bounded number of iterations

- Command line argument “-function”
  - Specifies an entry point

- Usage
  - cbmc64 ex02-loops.c -function sum
CBMC: example 3

- Program ex03-fact.c
  - Unbounded loop
  - Infinite unwinding

- Command line argument “--unwind N“

- Argument “--unwinding-assertions“
CBMC: example 4

• Program ex04-binsearch.c
  ▪ Loop bound cannot be determined statically

• Supported built-in properties
  ▪ Checking bounds for accesses to array elements
    • Parameter “--bounds-check”
  ▪ Checking null dereferences
    • Parameter “--pointer-check”
